## Cytogenetics of Cells in Culture

Cytogenetics of Cells in Culture is a compendium of papers that deals with techniques to detect patterns of DNA replication, cellular control mechanisms, and chromosome analyses with automated instrumentation. Some papers discuss the effects of cell hybridization and of noxious substances such as radiation, chemical agents, and viruses on chromosomal patterns. Other papers focus on the influence of altered chromosomal complement on the survival of cells to long-term tissue culture or to ionizing radiation treatment. A couple of papers points out that naturally occurring chromosomal abnormalities in mammalian populations are relatively rare and are not necessarily associated with physical defects or disease. One paper notes that chromosomes in cells with different functions have different patterns of replication in which the changes are small and hidden. The chromosomes will usually be neutralized showing little of the characteristic pattern of replication or condensation during the early cleavage stages, that will later change into differentiated characteristic ways for each tissue type. Another paper describes chromosome breakage associated with viruses and DNA inhibitors. The compendium can prove beneficial for biochemists, micro-biologists, cellular researchers, and academicians involved in the study of cellular biology or physiology.
