The Chemistry of Superheavy Elements

The Chemistry of Superheavy Elements

The Chemistry of the Superheavy Elements provides a complete coverage of the chemistry of a series of elements beginning with atomic number 104 – the transactinide or superheavy elements – including their production in nuclear reactions at heavy-ion accelerators. The contributors to this work include many renowned scientists who, during the last decade, have made vast contributions towards understanding the chemistry of these elusive elements, both experimentally and theoretically. The main emphasis is on demonstrating the fascinating studies involved in probing the architecture of the periodic table at its uppermost end, where relativistic effects drastically influence chemical properties. All known chemical properties of these elements are described together with the experimental techniques applied to study these short-lived man-made elements one atom at a time. The status of theoretical chemistry and of empirical models is presented as well as aspects of nuclear physics. In addition, one chapter outlines the meanderings in this field from a historical perspective.
